

POWERSHELL BACKGROUND JOBS

Jeffery Hicks

Windows PowerShell MVP

jhicks@jdhitsolutions.com

AGENDA

- What is a job?
- Job Requirements
- Creating local jobs
- Creating remote jobs
- Managing Jobs
- Working with Job Results
- Troubleshooting Jobs
- What to do next
- Q&A

WHO AM I?

- Windows PowerShell MVP
- PowerShell Author
 - Windows PowerShell 2.0: TFM (with Don Jones)
 - Managing Active Directory with Windows PowerShell: TFM
- IT trainer and consultant

- <http://twitter.com/jeffhicks>

twitter

A NOTE...

- All demos and transcripts will be made available
- Demos are written mostly as one-liners.
- Focus on results not language

WHAT IS A JOB?

- PowerShell is single threaded
- Running a command at the prompt “blocks” PowerShell until complete
- A background job “pushes” a PowerShell command to the “background” via a new runspace.

WHAT IS A JOB?

- Jobs consist of one parent or executive job and one or more child jobs
- When you are ready, you can retrieve the results, if any
- No job notification process

JOB REQUIREMENTS

- PowerShell 2.0
- PowerShell Remoting (WinRM) configured, even if running jobs locally.
- PowerShell Remoting enabled and configured on remote computers for remote jobs.

CREATING LOCAL JOBS

- Start-Job
 - Script block
 - PowerShell script
 - Script blocks and scripts can accept parameters
- Cmdlet `-AsJob` parameter
 - `Get-WMIObject`
 - `Invoke-Command`
- Optionally, you can define a job name and/or save job to a variable

DEMO #1

CREATING REMOTE JOBS

- Use the Invoke-Command cmdlet
 - Computername
 - AsJob
 - Credential
- You can create background jobs on multiple remote machines
 - Computernames
 - PSSessions
- Job is created locally but command runs remotely

DEMO #2

MANAGING JOBS

- Use **Get-Job** to retrieve one or more jobs
- Use **Wait-Job** to wait for a given job to complete.
More useful in a PowerShell script
- Use **Stop-Job** to terminate a job
- Jobs cache ends when PowerShell session ends
- Use **Remove-Job** to manually clear one or more jobs

WORKING WITH JOB RESULTS

- Results stored in a local job cache
- Use `Receive-Job` to get results
- Results cleared unless you use `-Keep`

```
PS C:\> $data=Receive-Job 3 -keep
```

DEMO #3

TROUBLESHOOTING JOBS

- Verify your command runs locally and interactively
- Verify WinRM and credentials with Test-WSMan
- Look at the JobStateInfo property on child jobs

```
PS C:\> (get-job 9).childjobs[0].jobstateinfo.reason
Access is denied. (Exception from HRESULT:
0x80070005 (E_ACCESSDENIED))
```

DEMO #4

QUESTIONS

RESOURCES

- Windows PowerShell 2.0: TFM by Don Jones and Jeffery Hicks
- Windows PowerShell in Action 2nd Ed. by Bruce Payette
- Windows PowerShell Cookbook 2nd Ed. by Lee Holmes
- Windows PowerShell Team blog (<http://blogs.msdn.com/powershell>)
- The Lonely Administrator (<http://jdhitsolutions.com/blog>)
- Prof. PowerShell (<http://mcpmag.com/articles/list/prof-powershell.aspx>)

SUMMARY

- Jobs require remoting
- Use Start-Job to create local background jobs with either script blocks or script files.
- Look for the `-AsJob` parameter in cmdlets
- Use Invoke-Command to create jobs for remote systems
- Keep job results
- Use Remove-Job to manually clear jobs
- Look at help and examples for all the job cmdlets
